

ANYONE CAN FALL

Prevent it from happening to you

Staying Confident Checklist

Any older adult who falls, with or without sustained injury, may develop a fear of falling. This may cause curtailment of activities, leading to reduced mobility and physical fitness, and increasing risk of falling and injury. Assessment of fear of falling, followed by appropriate interventions, is crucial to promote independence, mobility, function, wellness, and safety of older adults.

The Falls Efficacy Scale-International (FES-I) is a short, easy to administer tool that measures the level of concern about falling during 16 social and physical activities inside and outside the home whether the person does the activity or not.

FALLS ARE NOT A NORMAL PART OF AGING.
Talk to your health care provider if you have had a fall.

We would like to ask some questions about how concerned you are about the possibility of falling.

Please reply thinking about how you usually do the activity. If you currently don't do the activity (e.g. if someone does your shopping for you), please answer to show whether you think you would be concerned about falling **IF** you did the activity. For each of the following activities, please tick the box which is closest to your own opinion to show how concerned you are that you might fall if you did this activity.
